

Access control from the top of the world

**Defend Against Threats,
open the door to opportunities**

Hedengren Access Management

The new level of access control is here

Hedengren Access Management is a new generation access control system with features that don't stop at the most critical sites. The system is an openly integratable, fully browser-based and 100% end-to-end encrypted platform that allows you to reliably manage locks, unlocks and access anywhere. The system is virtually infinitely scalable - from a single property to large complexes in different locations or countries. It is suitable for both commercial and public sector operators, as well as strategic organisations in critical infrastructure.

100% protected

These are challenging times for security. For example, phenomena related to the growth of cybercrime are reported daily. Hedengren Security meets these challenges by providing access control systems that meet the highest security requirements. With Hedengren Access Management, you can stay on top of the situation. You decide to whom the door opens and when.

The end-to-end encryption makes the system the perfect choice for the most demanding security actors, such as national defence, border security, prison services and the energy sector. A high-level, unbroken chain of encryption technology extends from the user ID through the door or IP controller to the database and user interface.

Scalable from one to infinity

Hedengren Access Management is suitable for organisations of different types and sizes. It can be used to manage a single site or even the different sites of an international group. The platform's features have been developed from the ground up to meet the needs of multi-site and multi-user environments. The platform features are actively updated. An agile system is always ready to meet future challenges, whether they concern legislation, technology or changes within your organisation.

Hedengren Access Management in a nutshell

- end-to-end encrypted
- unlimited scalability
- fully web-based
- cloud service or local installation
- clear web interface without software installation
- open integrations
- developed for multi-site and multi-user environments
- extensible with modules in the same database and interface
- developed in Europe, expert support from Hedengren

Incredibly flexible and integrable

The modernity of the platform is evident in its openness and flexibility. The Hedengren Access Management system has functional integrations with numerous third-party applications. It comes with standard or integrable features such as parking, visitor and reservation management, fire alarm and video surveillance systems. In your day-to-day work, the system's flexible modularity means ease of use and time savings - practical efficiency for your organisation.

Hedengren Access Management supports a number of high-level identification technologies, including biometric identification. It is compatible with a wide range of new generation readers. A variety of physical and mobile sensors as well as electromechanical and digital keys can be used for unlocking.

On your own server or in the cloud

If you want to have the system on your own server, Hedengren Access Management will do the job. If, on the other hand, you value reliable access management without large hardware purchases and separate software installations, we recommend purchasing the platform as a cloud service. With SaaS, the purchase costs are spread over the entire contract period and you always have the latest software version at your disposal.

Safety platform from the top of the world

Intuitive and flexible user interface

The Hedengren Access Management system interface is easy to use and can be customised to your needs. It can be used directly in a web browser without any software installation or special requirements for the workstation. For mobile devices, a dedicated app is available for Android and iOS platforms.

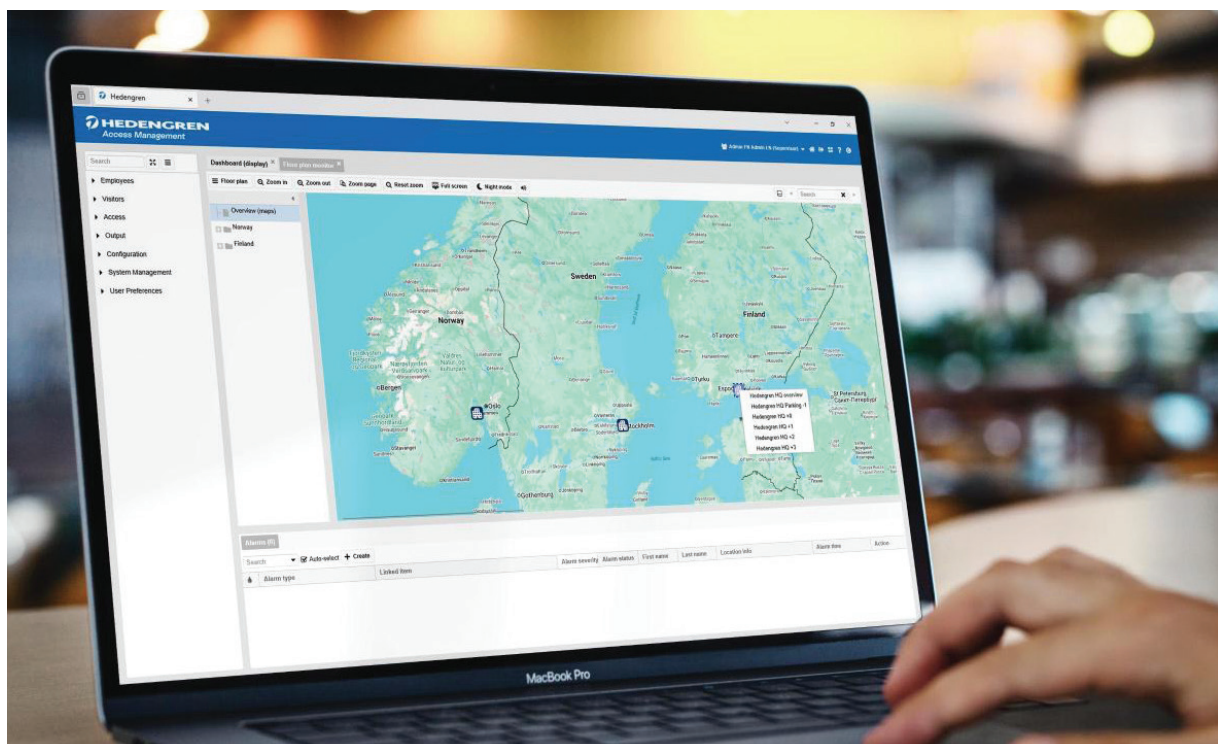

For example, different access rights and views can be set up for customer service and the control room. Access rights can be extensively customised to suit the needs of the operator. The system's clear user interface integrates the entire security environment - keys, locks, access rights, users and properties, as well as the various systems - into a single, easy-to-manage entity.

Made in Europe, support close to home in your own language

The Hedengren Access Management platform was developed by Synguard of Belgium. The system and its various applications are widely used in Central Europe, with a wide range of references from both the commercial and public sectors

In the Nordic countries, Hedengren Security is a licensed agent with experience in the field, providing your organisation with expert technical support during implementation and operation. A separate product training programme is available for Hedengren Access Management partners. Keep in touch and unauthorised trespassers out of the door!

The platform features have been developed from the platform to meet the needs of the multi-site and multi-user environment.
